Mobile Coding Endproject 'VoKo'

Nathalie Klinger | cc211040

Idea of the project

I started by using pen and paper to write down what I will need: 2 Activities, I thought about adding Fragments but ditched the idea. My Database contains an id, korean word and english word.

The first Activity is called 'VocabActivity' and shows the list of Vocabulary, where you'll find a Button to add new vocabulary. The words itself are EditText fields, so you can click and edit them by pressing the edit button, next to it is the delete button.

December 2022

Due to other projects with a closer deadline, I did not work on the Mobile Coding Project. I started with a Figma file to do a Design prototype but didn't finish yet.

January 2023

After learning a lot in the Creative Code Lab I thought it would be easy to start this project, which was true to some point - I know easily can navigate through the .xml and design apps, but working on the Database is still pretty hard. I'm not sure how to translate the example code we have on ecampus to my use-case.

February 2023

I believe I figured out the Database handler, but now I've got some errors in my Recycler view. It throws a weird AAR Metadata error and I can't find a solution for it. Victor fixed my Android Studio during the CodeLab, but it doesn't work again so I can't use the Emulator to see if my app even runs and I don't have an Android phone to test it.

Ultimately, this is the main reason why my app isn't the way it's supposed to - I can't build it because of the AAR Metadata error so I don't see what's working and what isn't. I understand if I have to go for the second attempt since it isn't working, but I can't fix this alone.
